SWEET RETREAT

Sweat retreat is a new phenotype of agricultural organisation and an upgrade: of the agricultural landscape. It provides for a more involved food-production. A more diversely used an appreciated food-: producing landscape. And an alternative economic model to current farming practice.

Sweet retreat rebalances urban life(styles) with manual labour, space to think and air to: breathe. It provides for self produced quality food, and shifts the land from mono-culture to poly-culture. In produce and socially. Together we make (y)our food, (and eat it to)

The agricultural production landscape in the center of the arnhem nijmegen urban: area demands an upgrade to re-prove its value to the regions residents. Therefore existing farmlands will be adopted by new: communities that will become both (multi) functional farms and a retreat to escape from : hectic urban lifestyle.

Urban residents will "crowd farm" as: professional amateurs and be the long sought after successors of the retiring farmers. "Parttime farming" as a second (or first) job.

A second living and working environment to apply your other skills, and to provide for best quality food. Be both Java developer ánd farmer.

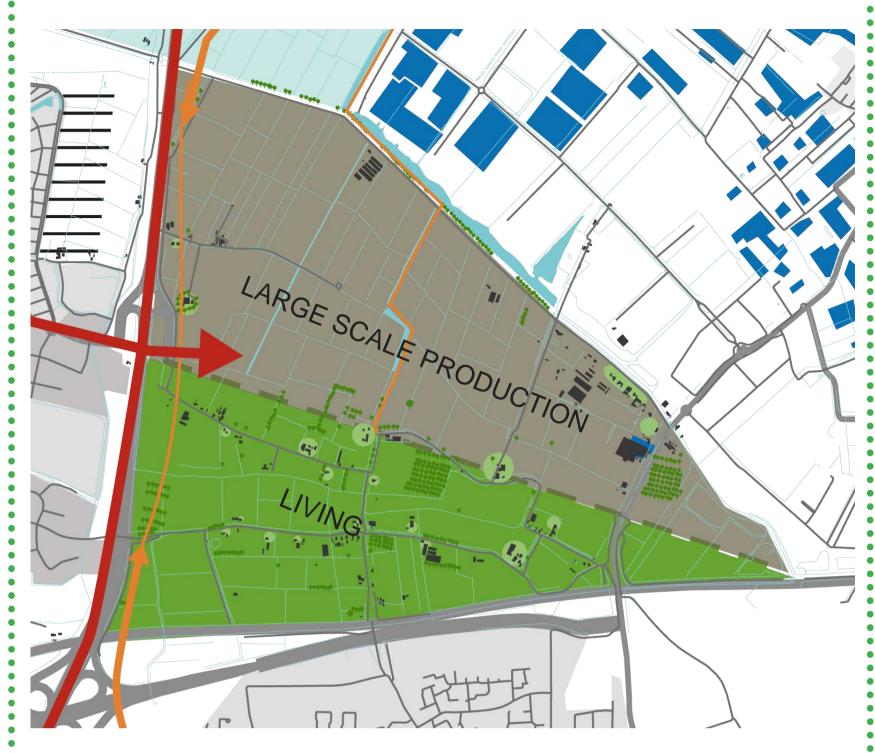

agricultural phenotype of organisation is an alternative economical model based on locality, quality, emotion, experience and sharing, and opposes the upscaling into mega-companies. It diminishes and shares riscs, and might be one of few ways to preserve local food production.

It gives opportunity to deal with future climate change by improving the lands margins to store water during heavy rainfall, to be used in the ever dryer summers.

Sweat Retreat is about knowing your food, getting the very best quality, diverse: and uncommon products, about picking it yourself, and enjoying it together.

FROM AN APPOLONIAN RATIONAL MONO LANDSCAPE

Rational block allotment, aimed at fast drainage, and to give ever larger machines : Water retaining, biodiversity, small scaled, human powered quantity driven. Pretty to see, Unattractive to reside in. Very limited accessibility, 🕻 driven. An attractive place that people will want to be in. Shared, and open. private property.

NARROW MARGINS

Financially and physically. High efficiency and large scale demand a strictness vithout resellers produce has the right price. Plus the waterbuffers have high Permaculture needs more hands to do the work. Luckily people want that is only visually appealing. Weed complicates harvest thus is sprayed upon, value, for recreation, pollination, soilbuilding and wild edibles, like nettle etc.

MONO PRODUCE

large bulk production makes dependant on resellers. they make the

MONO FARMER

All the riscs reside at one. necessity to "play it safe" and calculate risc, upscale for efficiency etc.

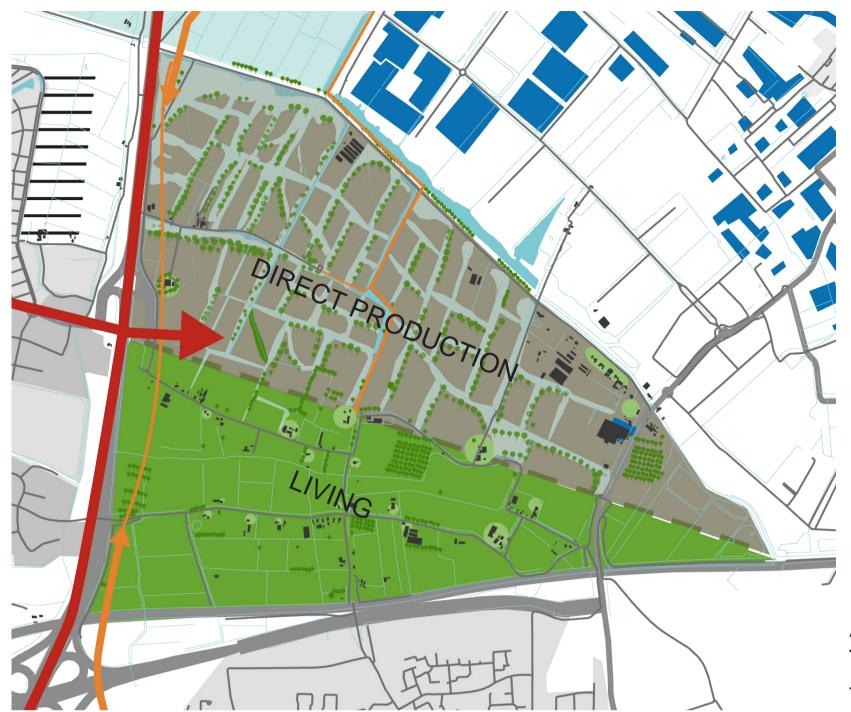

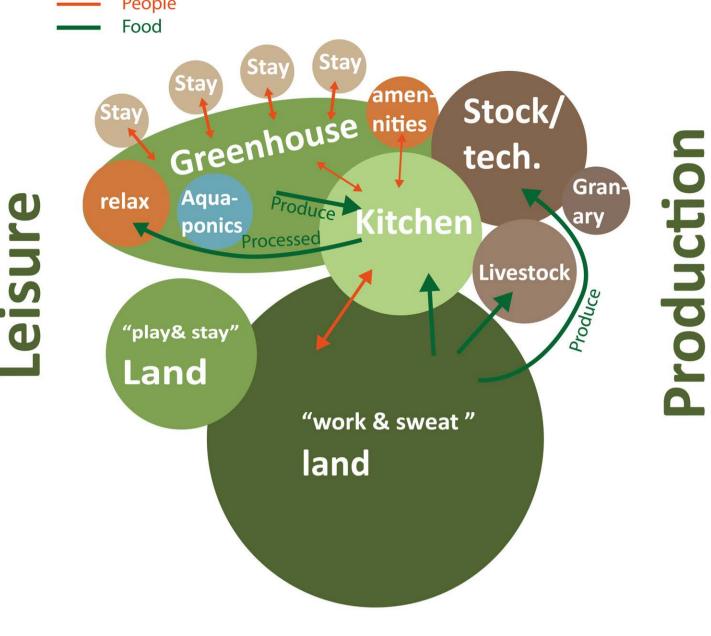

FERTILISATION

Ploughing, and very exhaustive behaviour are depleting the soil of humus. Originally the clay became fertile by floods and ages of wild forests. not since we dammed of course. now we artificially simulate that.

TO A DIONYSIAN EXPERIENCE POLY LANDSCAPE

access. Ploughed, fertilized, sprayed, drained, and extracted. Efficiency and : "permaculture" style. Cyclic, soilbuilding, sustainable. Experience and quality

SWEETRETREAT

A DIFFERENT PROGRAMME

This more diverse landscape invites people. And asks to accommodate them. They come to "work" for relaxation, and quality food.

ABUNDANT MARGINS

DIVERSE PRODUCE

interesting for people to help.

A DIFFERENT USER, CROWD FARMERS

to grow their own food, in an attractive way. A new communal farm will be that place. Urbanites unite as farming collective, they become Diversity and selling directly to the user BOTH FARMER ÁND JAVA DEVELOPER.

makes for a right price, and way more a "secondary job" for fun, as a retreat, a second living environment, an investment, a foodsource, a place to explore other talents. Not everybody will be as involved. A group will start by getting the land, "the founding fathers" via crowd sourcing, by food subscriptions etc the project will be funded.

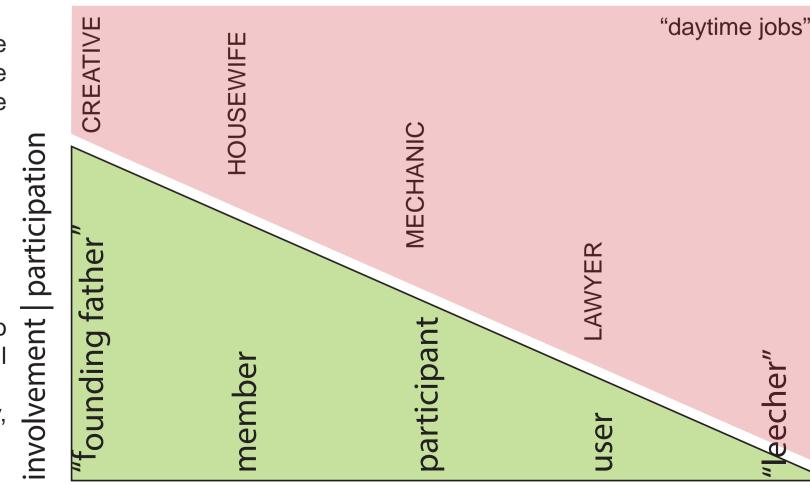

CROWD FARMING

Riscs are shared, many hands make light work. Even if a harvest fails, the nett worth is great! the land itself is the

FERTILISATION

Cycles, returning organic materials into the soil. composting, "wild" margins all help (re) building soil and humus. which helps retaining moist enormously, usefull with climate changes at hand.

MODULAR SECTION

The building is based on a repeating wooden framework on an elevated base, for protection against moist and damaging. The base for the structure is a "coupler" the connector that contains all ducts and pipes for drains, water and electricity. The remaining foundations will be as minimal as possible.

The barn has a utilitaria character, it has a large floorspace, good isolation, very little heating. the basic frame will be extended to increase floor space to accommodate some small livestock. for dairy, meat, eggs...and heat.

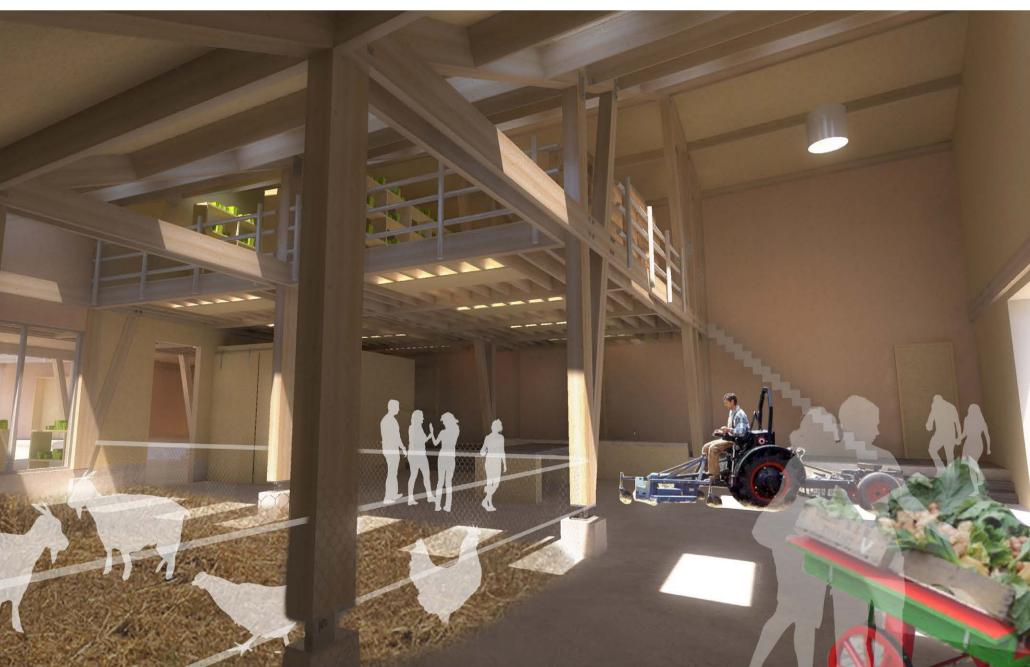

EXPERIENCING FOOD IN THE KITCHEN

The cooking and preparation takes place on a podium, to divide the large space into more intimate Learning about food, there is a library to read about it, and the grouproom can be used as a "living" places. A large mud constructed multiple oven heats the kitchen via heatcoils and underfloorheating. and for lectures or workshops. the hearth is a gathering place, and utilitarian. the front of the kitchen is for dining, and when the harvest has been abundant, the room functions as a shop. Whenever the climate allows, the kitchen is open to the greenhouse.

GROUPROOM WITH LIBRARY AND OFFICE

BARN, TECHNICS, PROCESSING AND STORAGE, SANITARY AND LIVESTOCK The bare necessity for working the fields. Here the harvest is brought in, to be cleaned sorted and stored. The small machinery (solar tractor) and tools will be stored here. Toilets and shower will be connected to the "coupler" as well as the technics room with the waterpump and solar equipment.

2200

BASIC ROOM

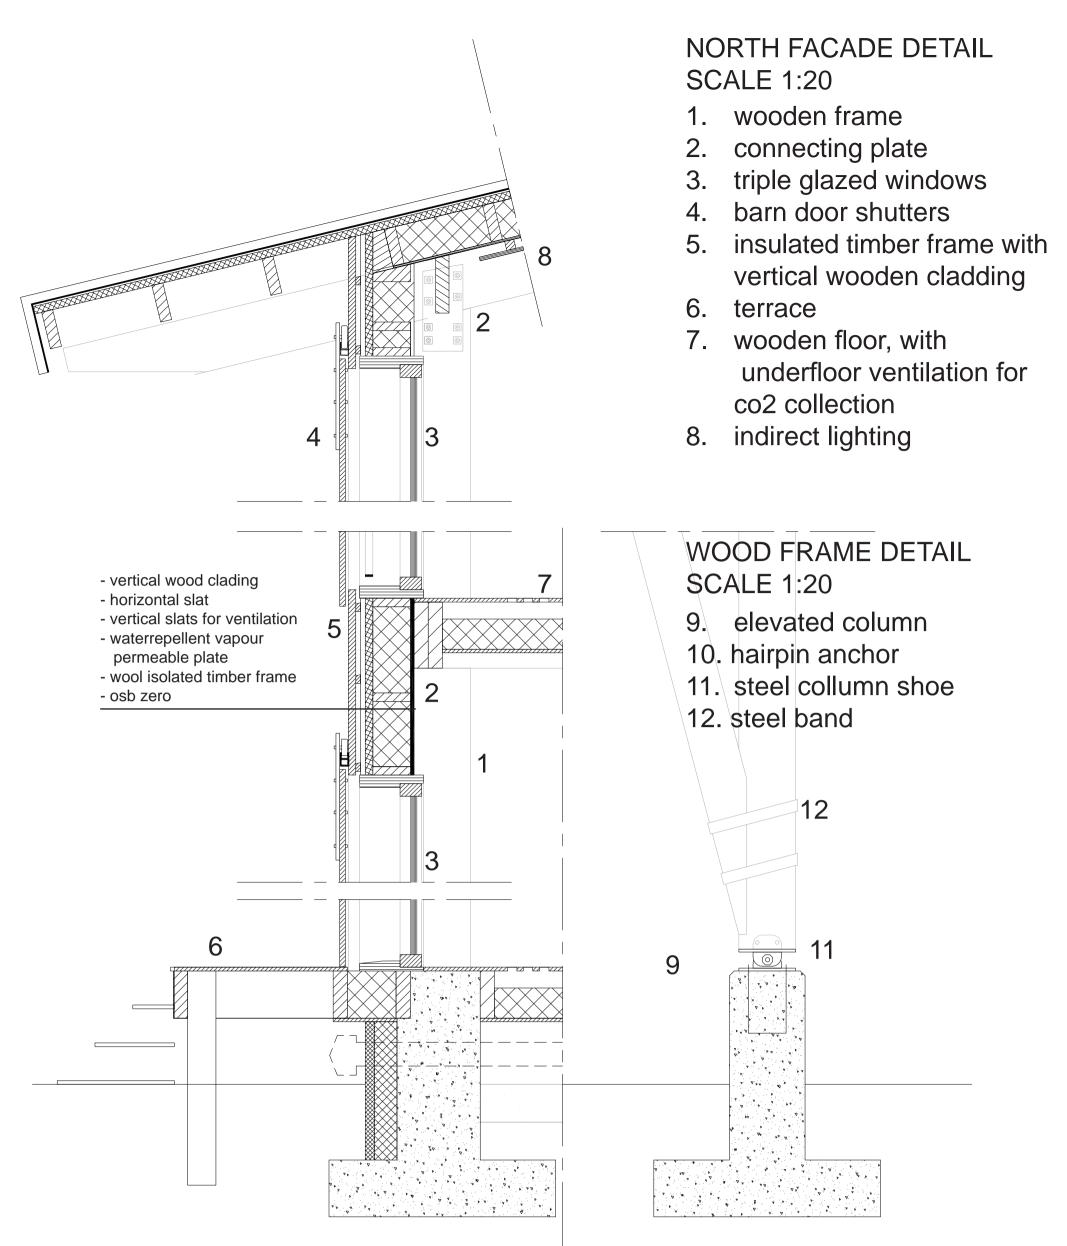

The north side of the building is a sheltered place, with lots of water that is protected from Every sleeping unit has basic amenities, water a shower and warmth (slow, wood fired so you'll For the more demanding farmer that either comes with a family or stays for a longer period, there

person rooms, or 4. traffic space on the greenhouse side can be occupied when the climate invites. cladding of timberframe will be bare and essential.

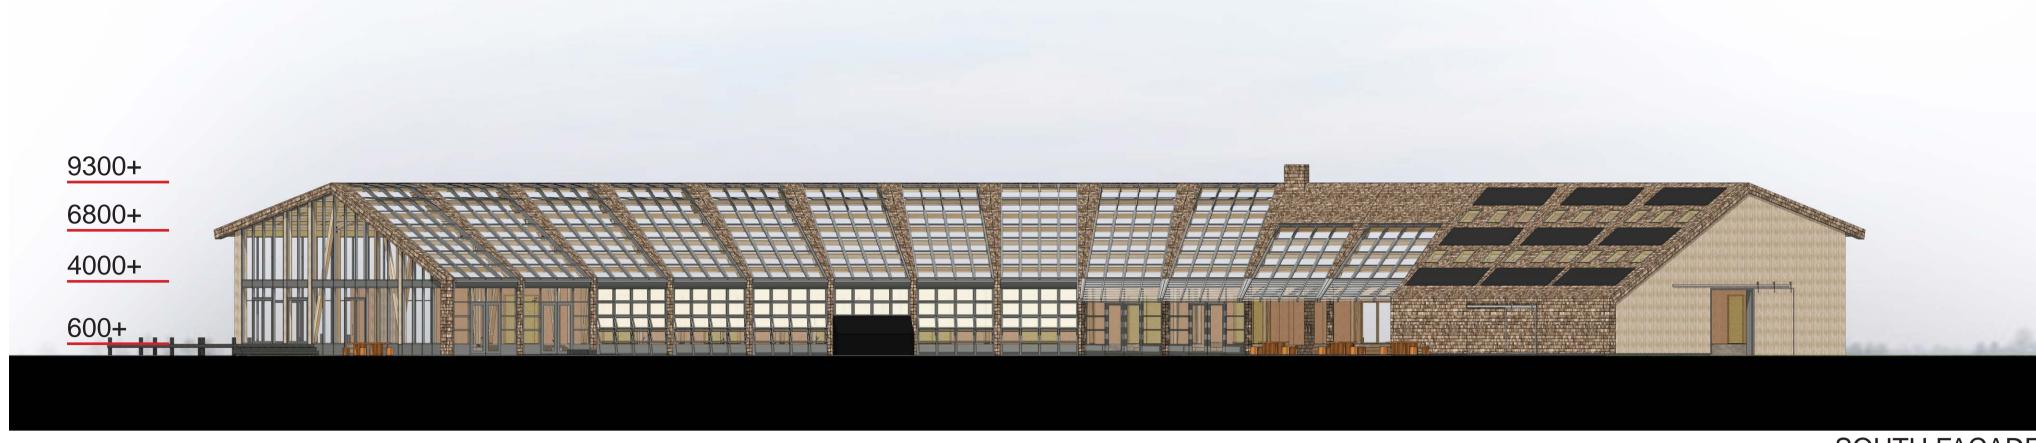

FAMILY / LUXURY APPARTMENT

is the luxury room. Two floors are combined. a living room on ground level with a small pantry. Willow marsh forest. from your steps, or terrace, you can take an early morning stroll to the rooms have been designed to fit either a twoperson bed, or two bunkbeds. making this either 2 materials used on the interior are compressed earth blocks and mud, for all mass walls. interior

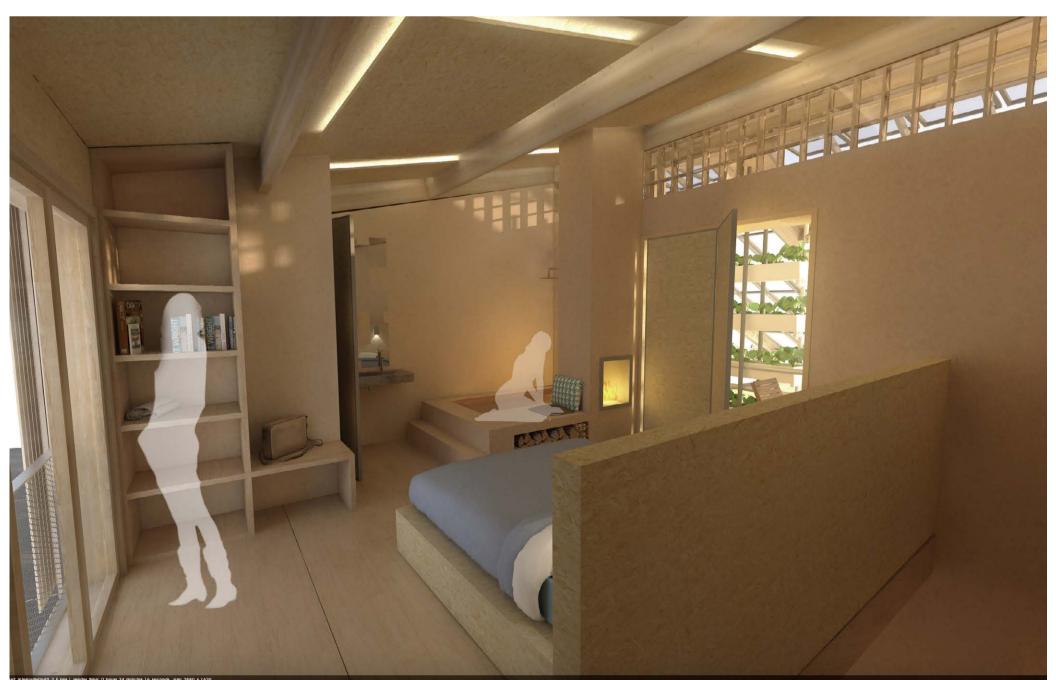

SOUTH FACADE

Open and welcoming. Large barndoor on the east for natural protection against rain and wind. Communal kitchen is inviting, depending on the season the "over doors" will be open, sheltered from entering rain. Mostly glass and polycarbonate, the barn is more solid and clad with local wood shingles

NORTH FACADE

Mostly closed, wood clad, well isolated, triple glazed and with shutters for privacy and additional isolation. Terraces provide access to the marsh and flood lands, the north side of the building is mostly `wild' an early morning stroll or some fishing in the coolth of the water will be refreshing.

LUXURY ROOM

A bath to enjoy, relax your musscles after a hard days working the field. comes from the greenhouse.

GREENHOUSE

practiced for foodproduction. The framework allows for attaching "attributes" like the solar dryer.

RETREAT

The greenhouse provides for an extended growing season. It also is a special place to be. On After a hard days work you have earned that hottub, the natural swimming pool is inviting to cool late evening light enters through the glass on the greenhouse side. The climate will be comfortable summer days the screens are down and there is a diffuse warm light. Near the aquaponics ponds off. inside this part of the greenhouse planting is aimed at giving lots of scent. to enhance this there due to the mass heater and the natural materials used. the mud controls the moist, oxigen rich air the temperature will lower. Experiments in growing, but "regular" permaculture growing will be is a lowered seating area, so you sit with the pants at nose hight. plenty of large doors open to the evening terrace on the west, where in summe she sun doesnt set before 10pm.
